

UNITED PERSIAN * QUARTERLY

VOLUME VI, NO. 1

THE OFFICIAL PUBLICATION OF THE UNITED PERSIAN SOCIETY, INC.

MARCH 1971

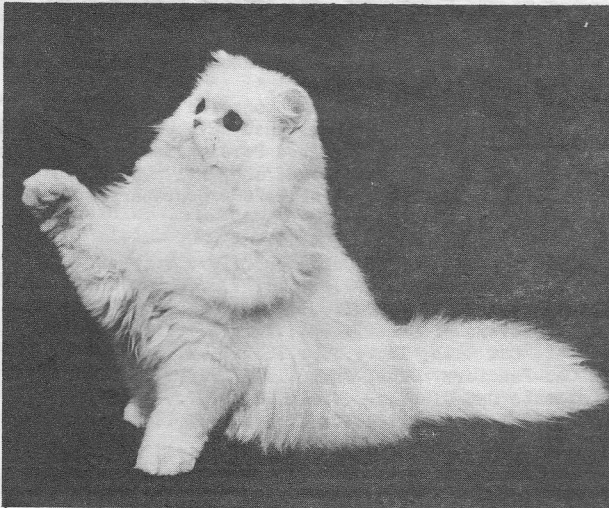

CFA BOARD NEWS

Recent Board actions have been numerous and to some extent the board has been much more productive than at any time in recent years. The effect of some of this action is that the CFA show rules have been changed in many respects. A number of these changes take effect May 1, 1971, while certain other changes will not go into effect until May 1, 1972. In any case it will be imperative for all exhibitors to become acquainted with these changes. The easiest way is to purchase a copy (for 25¢) from the Central Office. The newly revised rules should be available for purchase by May 1.

Some of the revisions to the show rules are (briefly):

- 1.) Entry to be accepted by a club must include CFA registration number on the entry blank.
- 2.) In addition to fungus, infectious or contagious diseases, show veterinarians will disqualify cats for showing evidence of fleas or ear mites.
- 3.) In the event a cat is disqualified for the above reason, all cats entered by the owner will be disqualified as well as all cats agented by the owner.
- 4.) Effective May 1, 1972, six winners ribbons will be required for completing a championship.

UPS NEWS

The United Persian Society 5th Annual all Longhair Show was held December 5th and 6th, 1970 at Memorial Hall, Racine, Wisconsin. There were 143 beautiful entries, an increase over last year in spite of having dropped the household pet class which in that area did not seem to have sufficient appeal. The 143 entries was just 7 short of the capacity number of 150 the club planned to take.

It was A BEAUTIFUL SHOW not only from the standpoint of quality of the cats presented, which reach the pinnacle of perfection of the cats being bred today, but also because it is a slower moving show having but two rings each day. There is never the nervous apprehension of missing a call, of not having sufficient time for grooming, or of wondering if there will be a few minutes for a bit of nourishment midday. There is always time for everything, for visiting with friends and other exhibitors, and admiring the entries of others which come from the four corners of the country. Any type of win at the United Persian Society's All Longhair Show is something to be cherished and remembered because of the excellent competition in all color classes.

Last year's big winner, Vi Jon's Peaches Girl, owned by Mrs. Raymond Klotz was again present, showing herself with her usual grace and confidence but on Saturday, the first day of the show, she was not the top cat. Instead, the honor was taken by Ol Ray's Blue Mist, also owned by Mrs. Klotz. Blue Mist is a Blue female youngster barely 8 months and 3 weeks of age who had just made her championship 2 weeks earlier in another show. The thought occurred to this reporter, "The Queen is dead - long live the Queen."

Sunday's judging brought different results and the grand old lady (who is really not so old) was Best Cat in Mr. Thompson's ring.

The results of all four rings are given below.

Year after year there is a consistent improvement in the quality of cats, indicating a truly concerted effort of the part of breeders to produce cats conforming to the Standards. This fact is obvious, not only in the number, but in the quality of babies coming to the shows. Each succeeding year brings more and more lovely kittens and the place to see them is at the United Persian Society's All Longhair Show, a yearly event enjoyed to the utmost by exhibitors and spectators alike.

CFA BOARD NEWS (CONT.)

- 5.) Effective May 1, 1972, 150 grand points required for a grand championship.
- 6.) Effective May 1, 1971, a top five win will satisfy the "best champion" requirement for a grand championship.
- 7.) Number of cats that can be accepted for a one judge show (2 days) was increased to 400 (including absentees). For a one day show 175 can be accepted.
- 8.) No award requiring the decision of a judge other than official CFA awards can be offered in the club's premium list. (i.e. Best Cameo, Best White, etc).
- 9.) An official championship claim form must be printed or inserted in each show catalog.
- 10.) Effective May 1, 1971, any club may request permission to put on a show in which 2nd best is substituted for BOX in all categories.
- 11.) In color and breed specialty shows, a minimum fee of \$12.00 is established. (Judge's fee)

There have been numerous other changes to the rules, many of which are concerned with show management. Any readers who are involved with putting on shows should avail themselves of a complete copy of the new rules as soon as possible.

OTHER ACTIONS

The board proposed a constitutional amendment to be presented at the Annual Meeting in June the purpose of which is to eliminate the "45 day" rule. This rule requires candidates for CFA office to declare their candidacy 45 days prior to the annual meeting. The rule has been a bane to the "politicians" ever since its adoption at the Miami Annual in 1969.

Bi-Color Persians were accepted into championship competition by the board after many years of effort on the part of their supporters. Bi-Colors of course have always been registered persians but because of a lack of color class they had to be shown as AOV. Establishment of color classes will now allow them to compete on a par with other persians.

Initially color classes will be, any solid color with white (i.e. black and white, red and white, blue and white, and cream and white). Bi-colors will be placed in the parti-color division, thus for the first time it will be possible to have an opposite-sex parti-color.

UPS SHOW SPONSORSHIP

By the end of the 1970-71 show season the United Persian Society will have sponsored 32 shows throughout the country. This is the greatest show sponsorship for a specialty club in the history of the cat fancy. The important thing about this fact is that it gives UPS members around the country ample opportunity to have their cats scored in the UPS Cup List competition. Winners for the 1970-71 season will be announced in the next issue of the Quarterly.

Listed below are shows being sponsored by UPS for the remainder of this season plus shows that have contracted for next season (1971-72). Remember, United Persian Society will sponsor a ring in your show free of charge, and will supply a Best Cat rosette for open competition. Write the Secretary if your club would like to have an UPS ring.

Confederation Cat Fanciers (Canada).....	Feb. 20-21, 1971
Lincoln State Cat Club.....	Feb. 27-28, 1971

CLUB DUES

If you received a dues billing on your last Quarterly (on the address portion) and have not yet paid them this will be the last issue you will receive. To assure continued receipt of future Quarterlies why not send in your dues today?

UPS SIXTH ANNUAL ALL LONGHAIR SHOW

It may seem somewhat early to make announcements in this issue of the Quarterly about the United Persian Society's Sixth Annual All Longhair Show which will be held December 4th and 5th of this year. Most of the information will be published in later issues.

It is not too soon, however, to mention one or two points.

The United Persian Society shall of course endeavor to always put on the finest show possible and give its exhibitors

(Continued, Page 7, Column 1)

MAMMALIAN COAT PIGMENTATION

by ROY ROBINSON

The following is the conclusion of an article begun in the last issue (Vol. V, No. 4) of the Quarterly. If you missed the first part, copies of Vol. V, No. 4 are available at a cost of 50¢. This article first appeared in the Bulletin of the Feline Advisory Bureau and is reprinted here with their permission.

Heredity and gene action

All of the colours described above are due to single saltational steps in the biosynthesis of coat colour. Each step is due to the mutation of a gene concerned in the physiological processes which culminate in the normal tabby. Self black, brown and blue dilution are due to genes which are inherited as recessives to normal. The silver, Burmese and Siamese genes are also inherited as recessive to normal but differ from the previous three in that they are mutations of the same wild type gene. That is to say, they are mutations at the same locus. The heredity of yellow in the cat is a peculiarity of mammalian coat colour genetics since the responsible gene is sex-linked. The gene is borne by the X chromosome with the result that the heterozygous female possesses a patchwork of yellow and tabby according to the dictates of inactivation of one X chromosome.

The genesis of the agouti colour has been an intriguing problem of some standing. The production of the self black animal is easily visualised since the melanocytes apparently contribute a stream of eumelanin granules to the growing hair. With the agouti hair, however, the stream of eumelanin granules is interrupted for a period, during which pheomelanin is produced. The mechanism by which the reversible change-over is engendered is largely unknown, though the work of Cleffmann (1) has shown that the rate of cell division in the hair follicle and a threshold concentration of sulphhydryl compounds may be factors to consider. On the other hand, there is experimental evidence that agouti is due to the genetic constitution of the hair follicular cells and not to the constitution of the melanocytes. This has been shown by grafting experiments in mice, in which lightly pigmented albinotic agouti skin was transplanted into self black animals (6). It is known that melanocytes migrate across the boundary between graft and host tissue and take part in supplying pigment to the host tissue. Some of the hairs produced by the graft tissue were normal agouti, demonstrating that the type of granule formed by the migrated melanocyte was determined by the follicular tissue.

One could probably argue reversely from the above and say that the albino genes inhibit the development of pigmented granules regardless of the genotype of the follicular cells. That is, the albino genes produce their effects in the melanocyte and not in the follicular cell. A similar situation of intra-melanocyte action may exist for the brown gene. On the other hand, in the case of the dilution gene, the relationship between the melanocyte and follicular tissue shows signs of being a little more complex. The normal melanocyte has numerous branched extensions in intimate contact with the Malpighian cells but the melanocyte of the dilute individual has weakly developed extensions. When, however, tissue containing genetically dilute melanocytes are transplanted to the anterior chamber of the eye, the melanocytes are able to develop more and longer extensions which are almost normal. The reason for this appears to be that the tissue growth in the eye chamber is less dense than that of the epidermis and the incapacity of the dilute melanocyte to make extensive branches is not revealed. Therefore, it would seem that the dilute gene impairs, but does not completely disrupt, the normal metabolic function of the melanocyte.

White Spotting

The various forms of white spotting which occur in mammals are quite different from colour changes. These may be regarded as "breakdowns" in the development of pigment forming tissue. The primordial tissue which eventually produces the melanocyte originates in the neural crest of the embryo. The neural crest cells arise between the junction of the neural tube and the ectoderm. As the embryo develops, these cells spread ventro-laterally, differentiating and occupying their ordained positions. The melanocytic tissue occurs in many organs of the body but particularly (for our purpose) in the basal layer of the epider-

mis which is responsible for pigmentation of the skin and around the hair bulbs to produce pigmentation of the hair. It is characteristic of many forms of white spotting that the stomach and extremities are white, even when much of the body is coloured. Furthermore, as the amount of white increases, the pigmented area often recedes anterior-dorsally. This fact could indicate that some forms of spotting are due to rate of spread of the melanocytic tissue. White spotting in cats may be of this nature since it tends to vary in the manner just outlined.

However, other forms of spotting are known in which the variation of expression does not proceed in this manner, hence the situation is apparently complicated. The white areas of spotted animals are typically devoid of melanocytes or of melanoblasts (primordial melanocytes). This implies either that the melanocytes fail to reach certain regions of the body or that, if they do, they fail to complete development in these regions. The completely white animal may be viewed as an extreme form of white spotting; indeed, these animals have been aptly described as being "one big spot". The fact that the eyes of most fully white animals are coloured is of significance. Pigmentation of certain eye structures (namely, the retinal epithelium) are not derived from the neural crest. Therefore, a disturbance of neural crest tissue which produces a white individual need not necessarily involve all the eye, with the result that the eye may remain wholly or partially pigmented. This could be the situation for the blue-eyed white cat.

Biochemical aspects

To conclude, it may be noted that very little has been said on biochemical aspects of melanogenesis. That is, at the molecular level. The reason for this is simple; the amount of precise information which is available is meagre. It is easy to say that melanin formation involves the conversion of a colourless substance (chromogen) to an insoluble dark brown compound which is probably a large polymer linked with a protein. The chromogen could be tyrosine and an important enzyme for one stage of the conversion, at least, is tyrosinase. This would be, of course, just one step in a complex series of biosynthetic stages. The synthesis occurs in the melanocytes and is centred about the melanin granule (or, to be accurate, a colourless premelanin core). It is interesting to note that more detailed conjectures have been made upon the formation of eumelanin than of pheomelanin. It appears to be more difficult to account satisfactorily for yellow pigment than for black. An excellent review of present concepts on this topic and the amount of painstaking work which has been undertaken has been provided by Fitzpatrick, Brunet and Kukita (3).

CFA SHOW REPORTS

The following reports are for 1970-71 CFA shows. We have reported the top wins in each show ring (All Breed and Longhair Specialties) and in detail only when these awards were won by a Longhaired cat. The format is as follows; Site of show and date; Judge (AB indicating All Breed); Awards; Name of Cat, Color and Sex, Sire and Dam in Parentheses. For SH wins in AB shows, SH alone is used. If a cat wins several awards in one weekend, only the name will be repeated. When a cat wins at several different shows, full information for that cat is given the first time.

LETTERS TO THE EDITOR

Dear Readers:

The letters which have been received in recent months of a complimentary nature have literally been too numerous to acknowledge or answer. I would like to thank you all. Knowing that the Quarterly has been enjoyed by so many is what makes the effort of the staff seem worthwhile.

The Editor

Dear Editor:

Just received the latest issue of the Quarterly - and per usual was excellent reading. You are to be commended!

Even the best publications make errors from time to time and we noted one in particular. I realize that this may be an instance of the material you received being in error rather than an error on your part.

On page eight - show reports - the Niagara Falls, Canada show - you have Matil Rotter as awarding 4th Best Cat to our Simbelair Mystique of Baji - a blue smoke female. Best Smoke and 4th Best Cat were actually awarded to the lovely Araho's Moonmist, black smoke female. The mistake was a logical one since both females were consecutively numbered in the catalog. Mystique has taken 4th Best Cat, but I'm afraid not at that show. In correcting your records is there any way you can double check that CFA has it recorded properly? The award represents a good number of points that Moonmist should be credited with.

Sincerely,
Sydney Keller

Niagara Falls - are you listening?

Editor

Dear Editor:

I'm glad to see that at least one regional vice-president of CFA tries to do the bidding of the members. Don Thompson of Dallas, the regional vice-president of the Gulf Shore region, sent out questionnaires to all the clubs in his region stating the items on the agenda at the Memphis meeting of the CFA board and asking their opinion on each. This is by far better than jumping in to something that doesn't have the support of the majority of the members and then having to retract it as a later date. I hope the other members of the board will take note of this and act accordingly. Let the new pun be "The members give and the members take away".

Sincerely,
Jerry Lee

Dear Editor:

I have enjoyed reading the Quarterly very much. Your show reports are done very well except I can't understand why you leave out the kitten class and the premiership class. I think these two classes should be given.

Sincerely,
Nancy Mayo

The problem all publications are faced with in regard to show reports is space. Including kittens and premiership in ours would double the amount of space required. Unfortunately we are unable to devote the additional space to show reports though we sympathize with your feelings.

Editor

Dear Editor:

Since we are novices to the Cat Fancy, we found Mrs. Maier's "Persian Standard" article most invaluable. Finally, the standard has been broken down and explained in plain language that even us amateurs can understand.

Keep up the really great work. We hope to be members for many, many years to come.

Sincerely,
Susan L. Osborne

Dear Editor:

I've been noticing the increasing numbers of cats who are chronic sneezers, both at home and in the show ring. A majority not necessarily the most extreme or short nosed, but range from silvers and blue creams to whites.

I have heard remarks from fellow exhibitors stating that all types of allergy tests have been performed by their vet. with no conclusive pollen, etc. found to be the irritant.

I have been panic stricken watching one of my own silvers sneezing blood and another with a problem of drying and shrinking of her nose leather during dry weather, grooming with powder

TEST YOUR FELINE I.Q.

In this issue the Feline I.Q. is concerned with show rules, not as they are sometimes practiced, but as the official CFA Show Rules state them. (Answers are on Page 8)

1. When a public address system is used at a show the numbers of all Cats to be brought to a ring including cats for final shall be announced. True___ False___.
2. A judge must disqualify any adult male entry which does not have at least one descended testicle. True___ False___.
3. The show management may require kittens to remain in the show room until the completion of the show. True___ False___.
4. A judge who completes his judging duties on Saturday is prohibited from clerking in another ring on Sunday. True___ False___.
5. A kitten under the age of 8 months which has been spayed or neutered is still eligible to be shown in the kitten class. True___ False___.

Is Talc a Killer?

The following article was written with dogs in mind. Its implications with regard to grooming of cats is obvious. It is reprinted through the courtesy of Dog World magazine.

by Pat Hopkins

How many of us breeder-exhibitors use talcum powder to groom dogs for the ring? I, for one, have been using it for years on my Pomeranians. It does a gorgeous job of separating the hair and gives a lovely well-groomed look to the dog. But, with recent newspapers articles of the dangers of inhaling talc, I'm beginning to come to the conclusion we all should recognize the probable danger to our dogs in using it. The first article I came across, mentioned teenagers and glue sniffing, also stating the fact that they were also breathing in aerosol containers and that some of the containers had talc which was poison to the lungs. This gave me pause to think, especially when at the same time I heard of a Pom dying of fluidfilled lungs. Could there be any connection? So, in discussing this with another Pom breeder asking her opinion, she told me of one of her Poms with pneumonia and another having lung congestion. She too, is beginning to wonder if these conditions could be brought on by talc in the lungs, as she also used it in grooming.

Then a few days later, my handler gave me a clipping from a newspaper, titled, "Baby Powder Kills 2000 Infants a Year in the U.S." Some of the findings in this article are as follows. Talcum powder is good for the baby's skin, but that is all it is good for, is the opinion of Dr. Martin Keogh of the Department of Health. It is absolute poison to the baby's internal organs. He personally believes over a quarter of a million infants have died from talcum powder and many million have had their life spans cut short before they really got a foothold in the world!

Talcum in its most refined state is a mineral derivative of talc rock, heavily purified and ground to the finest powder. Every time a container of talc is used a certain amount escapes into the air. Because it is light, a great amount can be in the air without being noticed. This talc is breathed in by the infant, slips into his lungs and lodges there. Everytime the talc is used, a new deposit is built up in the lungs, like successive doses of poison. Then the time comes when the baby rolls over in the night, his head momentarily in pillow or sheet. Their lungs are weak and they cannot combat anything with those flabby lung muscles. So they die, apparently for no reason!

(Continued, Page 7, Column 1)

or show hall conditions. I was even more concerned when both myself and one of my sons had a bleeding nose problem.

I have come to the conclusion that since this problem is more evident during the winter months, my home situation - cats and humans - stemmed from the lack of humidity in the air.

Our purchase of a home humidifier, and an occasional pan of boiling water on the stove during very cold weather has greatly relieved the discomfort to both cats and humans.

Sincerely,
Bobbie Volke

IS TALC A KILLER? (Continued)

In England, the British Medical Journal publishes a warning to mothers on talcum powder. It says young children, age 1 to 2 years, spill a fairly large amount of powder. Some is inhaled. Within an hour respiratory distress and signs of bronchitis develop. The Journal reported on five cases of talc poisoning. "Three babies died within 10 to 20 hours," it said, and advises mothers not to use it.

There is much more in this article, but this alone is enough to make me throw away all my talc. When one thinks of how we brush the talc out of the dog's coat into the air, one can see how much is being breathed in by both dog and owner!

In another newspaper article I have here, taken from the Phila. Inquirer, Oct. 5, 1969, Dr. Louise M. Gloeckner, vice president of American Medical Association, makes this remark during her discussion of spray can pollution of our homes. "Even a substance as innocent looking as talcum powder could be harmful if inhaled often!" Since we cannot expect our dogs to hold their breath while using these products, as one article advises humans to do, one is beginning to wonder what effect all these breathed in pollutants will do to our dogs over a period of time. At present I have one older stud with a bronchial condition that he has had ever since he finished to title in 1961. Now I wonder if the talc used at that time long ago is the cause of his cough he has had all these years since, when the doctors can find nothing wrong with him.

Reprinted from Dog World magazine - January 1971

UPS NEWS (Continued)

and members as many concessions as it can afford. It is not the club's desire, ever, to make a profit on its show - only to break even. Should there at any time be a small profit, our members may be sure that any such funds would be donated to a worthy organization doing research on the ailments of cats. In this field there is still much work to be done.

So to get to the one or two points: The ground work of course has been laid. The Show Committee has been selected, as well as the heads of each department. Also, the results of last year's show have enabled our members to once again vote to give free double cages to all adult cats.

Our show is exclusive, but not large. To date we have been able to accommodate only 150 cats, but remember they are all longhairs. With some rearrangements in setting up the cages in the hall, we might be able to enlarge the number to 175 but that would be the limit. Our show is always held in Racine, Wisconsin at Memorial Hall. This location offers many conveniences, viz. excellent motel accommodations, good food, plenty of parking space, - everything necessary for the comfort of our exhibitors. It is not, however, a location to compare with other shows which are held in large cities, even in shopping centers where so many people can be drawn to the show as to ensure a large gate. The United Persian Society show does not draw a large gate so the club cannot count on that type of revenue to defray expenses. Yet, the comfort and pleasure of our exhibitors is of prime importance - the atmosphere of the show, the relaxed pace, the ease in taking your exhibits up to the judging rings without pushing your way, with many apologies, through dense crowds, and the early closing hours. All these advantages are paramount over other considerations.

RA

JUDGES SELECTED

The final important point to mention at this time is that the judges have been selected for next seasons show. They are as follows:

Jeanie McPhee
Barbara Maier
Gen O'Neill
Donna Jean Thompson

More about them and about the show will appear in the next issue of the Quarterly.

RA

CFA ANNUAL

The CFA annual meeting will be held this year June 18th and 19th. If you have never been to an annual meeting and are interested in CFA and in cats you are urged to attend this year's meeting. Being in San Francisco it is an ideal time to combine a few days vacation in one of America's most interesting cities along with participation in CFA's biggest "show". Even if you are not a delegate you can enjoy the annual meeting and board meetings from the sidelines. Chances are, though if you come without delegate votes you will still be able to pick up proxy votes during registration.

THE HOTLINE

The Hotline is a column requesting information from professional individuals on a variety of subjects. The column in this issue is concerned with the field of Veterinary Medicine. The answers are provided by:

John Hanover, D.V.M.
Hanover Animal Hospital
Forest Park, Illinois

1. Do your findings indicate that by stimulating estrus through the use of pregnant mare serum (PMS) abnormal offspring are produced?

A. No, this has not been my experience. PMS is a product containing a mixture of follicle-stimulating hormone (FSH) and luteinizing hormone (LH) which are hormones normally secreted by the pituitary gland and very important in regulating the reproductive cycle. When these hormones are given to an otherwise normal, healthy female they should stimulate the ovaries resulting in ovulation. There is no reason to expect ova produced in this manner to differ from ova maturing under the influence of the cat's own FSH and LH. However, I would like to emphasize that this should be done only after a thorough examination since any pregnancy, normal or induced, in a female which is severely overweight, diseased, suffering from improper nutrition, etc. is inadvisable.

2. Does the cervix in a cat dilate before there are any visible signs of labor?

A. Yes, although the exact mechanism of parturition is not fully understood, it is known that the cervix dilates shortly before the onset of labor and probably under the influence of relaxin with one or more of the other hormones in proper balance. Before attempting to induce labor, especially if a few days early, it is wise to check the cervix since the hormone (usually oxytocin) used to induce labor cannot relax the cervix. If the cervix is still tightly closed, attempts to induce labor are likely to be unsuccessful and a cesarean section might be safer.

3. Is it true that cats have allergies? If so, is there any way to determine to what they are allergic?

A. Yes, cats do have allergies. There are methods of testing cats in an attempt to determine the material to which they are allergic. The most common test kits use either a skin scratch method or an intradermal injection of known material and later an evaluation is made of the animals reaction to the materials as evidenced by redness and swelling at the site of application. Unfortunately, in most cases, the results are disappointing in that the animal often reacts to many different substances or to things such as weed pollen (25 or more types) or house dust. In such cases it becomes impractical if not impossible to prevent the animal from coming into contact with the agents responsible.

4. What are the primary causes of eye (corneal) ulcers? What is the expected healing time for early, simple ulcers and for more severe ulcers?

A. Probably the most common cause of corneal ulceration is injury, either while fighting or in play. Other common causes are irritation from foreign material in the eye, chronic or severe acute infections of the eye, and chemical irritations.

The healing time for corneal ulcers varies greatly depending on the size of the ulcer and other factors such as infection. In very small corneal defects without infection you could expect good healing within 2 to 5 days with little or no vascularization of the cornea. Larger ulcers and ulcers complicated by infection require vascularization and control of the infection before they can begin to heal. Assuming a good response to the antibiotic used and no other complications, healing should be completed within 3 to 5 weeks.

(Continued, Page 8, Column 1)

In the event that your club is not able to send delegates, the United Persian Society will have several members in attendance and will be happy to carry or place your proxy votes. For information in this respect, contact Wilma Franco, United Persian Society President; 5565 S. 34th St., Milwaukee, Wisconsin.

LATE ISSUE

This issue of the Quarterly is late, in case you hadn't noticed. Many factors have been involved, but rather than make excuses suffice it to say that you will receive four issues before dues time comes up again. Our Apologies.

Photo by CURTIS

WYNDEN'S MANDY OF STARMIST

At the recent UPS show Mandy was judged Best Kitten by Harriet Wolfgang. She was among the top five kittens in the other three rings. A lovely black, Mandy is owned by Mrs. Richard Maier and was bred by Mrs. Keith Pevey.

THE HOTLINE (Continued)

In chronic ulcers and those in which the healing process seems to be stagnant, it becomes necessary to take some action to stimulate the healing process. Usually cauterizing the ulcer is indicated to remove the dead, inactive cells surrounding the ulcer, but this should be done only after careful evaluation of the entire eye. Again assuming a favorable response to treatment, you could expect good healing four to seven weeks following cauterization.

Occasionally an ulcer will not respond favorably to treatment, no matter how sound the treatment may be. There is really no maximum length of time for such an ulcer to heal, but six months to a year or more is possible.

At this point I think I had better define what I mean by a healed ulcer. I consider an ulcer to be healed when the corneal defect has been completely filled in by healthy cells and the area no longer takes a stain with fluorescein, a dye used to identify ulcerative areas. The cloudiness and vascularization of the cornea associated with the ulceration and healing will remain for some time after the ulcer is healed. Also, some degree of permanent scarring of the cornea can be expected in any large ulceration or in one which did not respond well to treatment.

5. What real value does an injection of normal serum have in preventing infection in a cat which has been or will be exposed to some disease?

A. Unfortunately, I can't give you first hand information on normal feline serum since we do not use it in our practice and I was not introduced to it in school. However, if anyone should know a product it should be the manufacturer of that product. So, I will now quote from the product catalog of one of the major pharmaceutical companies. "Normal (feline) serum is prepared from the blood of healthy cats in a method....." It is "indicated for the supportive treatment of cats suffering from the effects of external or internal hemorrhage, surgical traumatic shock, dehydration, and other conditions where serum therapy is indicated." And, from another company, normal serum "serves the same physiological purpose as whole blood and is to be preferred since no typing need be made before use." I find it hard to believe that these companies would miss out on the tremendous potential market for their product if it could help

prevent infection. Also, I had to look in a catalog 19 years old to find some of this information because normal feline serum wasn't listed in the more recent publications. It may not even be in production now.

But, let us assume that it is still available and you want to give your cat some before it goes to a show so that it won't catch something. First of all, in order to protect your cat, that serum must contain sufficient antibodies, for the specific disease to which your cat may be exposed, to prevent infection. The only way that serum could have those antibodies is if the cat, or cats, from which the serum was derived had a high immunity to that specific disease either from vaccination or from having had that disease and recovered with a high antibody titer (level) remaining in their blood. Now, if that serum contained antibodies due to vaccination of the donor cats, why isn't your cat vaccinated? Certainly this is much safer than giving an injection at the time of exposure, assuming you even know he will be or was exposed.

However, let us suppose there is no vaccine for the disease to which your cat may be exposed, as is more often the case. There are many such diseases, i.e. Rhinotracheitis, Influenza, Infectious Feline Conjunctivitis, P.P.L.O. Conjunctivitis, etc., all of which are highly contagious. But, one of the primary reasons that there is no vaccine and that they are so widespread and contagious is that they are all extremely poor antigens, - they do not cause much, if any, antibody production in the infected animal and what little antibody titer is present in the blood disappears rapidly after recovery. Because of this, even if the normal cats from which the serum was taken did happen to have had the specific disease or diseases to which your cat was or will be exposed, there is very little chance that the antibody titer remaining when the sample was taken will be high enough to be of any value.

TEST YOUR FELINE I.Q. - ANSWERS (Questions, Page 6)

The answers (below) are taken from the newly revised CFA Show Rules dated May 1971.

1. True. Rule #219.
2. False. Rule #54(d) An entry which has been passed by the Veterinarian, if entered as an adult male, shall be conclusively presumed for that show to have at least one descended testicle.
3. False. Rule #68.
4. True. Rule #216.
5. False. Rule #26.

Tep's Chokin X Nevah-Tep's Kushla of Lee-Cee)

MISCELLANY

THE CAT FANCY IN ENGLAND

Our regular feature, The Cat Fancy in England, is missing in this issue of the Quarterly, due to the extended mail strike in England over the winter. Hopefully, the next issue will again present this popular feature written by our correspondant, Miss. E. E. Sellar.

FAMOUS LONGHAIRED CATS

It is hoped that we can present in the next Quarterly a "Famous Cat" article (in our regular series) on Khyber's Boris II. A picture of Boris has been received from Florence Kemmer for which we are grateful. If any readers can supply us with information or anecdotes about Boris it would be useful and helpful in preparing the presentation on him.
